

SyselContinuity

‘SyselContinuity is «a get the business up and running» service guaranteeing «next business day» operations ,

The business continuity plan from SyselCloud® is designed to get the business running again following a major disaster. Disasters can take many forms. Whilst it is true that natural disasters such as flooding, hurricanes and earthquakes are rare, the most common causes of

catastrophic outages of IT systems can occur at any time – fire, power failures, software viruses, equipment failure, malicious damage, including sabotage perpetrated by discontented employees, etc.

REDUNDANCY IN YOUR IT SYSTEMS

Today few companies can afford to duplicate their information systems or to invest in enormous redundancy. **When a server is down or destroyed** (natural disaster, theft, server loss, malicious damage, etc.) **it can sometimes be days or even weeks** before the IT systems **can be up and running again.**

GET THE BUSINESS UP AND RUNNING

When a disaster occurs, the priority is to get the systems running again as quickly as possible and to minimise the effect of any loss. However, this is only possible if the company has prepared and planned for such an eventuality. **A company needs to have a disaster recovery plan in place and to ensure that it is regularly updated to reflect the changing business dynamics.** The plan needs to cover every aspect of recovery, down to providing desks and office space for key personnel. And the only way to ensure such a **recovery plan** will work in case of need is to have an effective solution plus the ability to carry out large-scale testing.

SYSELCONTINUITY : THE SOLUTION

Thanks to the virtualisation of the servers and the infrastructure, SyselContinuity is able to limit the downtime to the «Next Business Day», in other words to have the systems up and running again within 24 hours of the initial outage. **Servers can be recovered and restarted using our infrastructure, and your key applications** such as ERP, CRM, messaging, extranet, etc., can be operational again, **based on the most recent backups.** In addition to these technical aspects, SyselContinuity also includes offices and desks made available to the staff who will be handling the company's detailed recovery operation.
